Dashboard Design

Date	27 October 2026
Team ID	
Project Name	Health360: Comprehensive Healthcare Risk & Disease Analytics
Maximum Marks	5 Marks

Dashboard purpose

The Health360 dashboard brings key patient health indicators and lifestyle-related risk patterns into one interactive view. It helps users explore the distribution of selected conditions—including heart disease, diabetes and stroke—and compare observed patterns across BMI groups, exercise categories and age groups. The dashboard is intended for descriptive analysis and exploration; the visualized associations do not establish causation or provide an individual medical diagnosis.

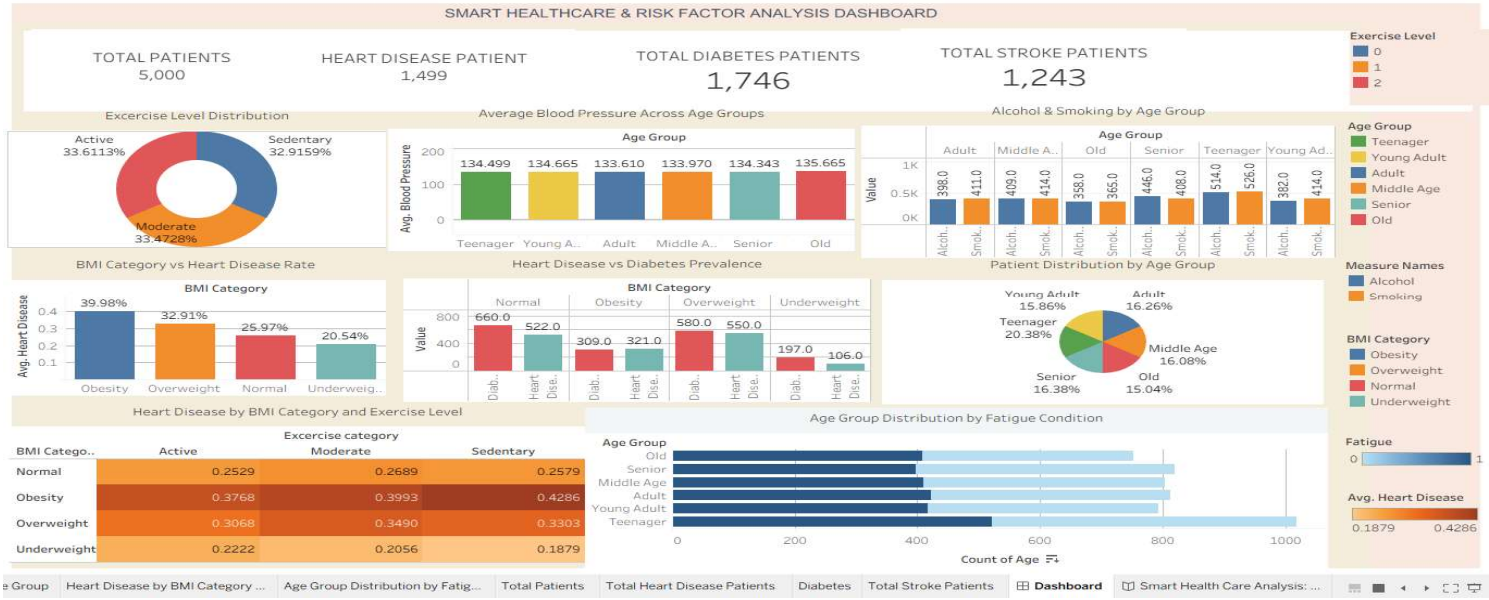

Dashboard layout and visual components

Worksheet / component	Visualization type	Purpose in dashboard
Disease Overview	KPI cards / summary figures	Summarize the total patient records and counts for heart disease, diabetes and stroke.
Heart Disease by BMI	Comparative bar chart	Compare the displayed heart-disease rate across underweight, normal, overweight and obesity groups.
Disease by Exercise Category	Comparative chart	Compare the displayed disease-related measure across active, moderate and sedentary exercise categories.
Average Blood Pressure by Age Group	Line or bar chart	Compare average blood-pressure values across age groups and identify differences in the displayed averages.
BMI and Exercise Risk Pattern	Heatmap	Show how the selected risk measure varies across BMI and exercise-category combinations.

Example values observed in the dashboard

The following values were noted from the project dashboard screenshots shared during preparation.

Total patient records	5,000
Heart disease count	1,499
Diabetes count	1,746
Stroke count	1,243
Heart disease rate by BMI	Obesity 39.98%; Overweight 32.91%; Normal 25.97%; Underweight 20.54%
Exercise categories shown	Active 33.61%; Moderate 33.47%; Sedentary 32.92%
Average blood pressure by age group	Approximately 133.6–135.7 across the displayed groups
Highest heatmap value noted	Approximately 0.4286 for the obesity + sedentary combination

Design and usability decisions

- Use a clear dashboard title and descriptive chart titles so users can understand each view without guessing.
- Keep labels, legends and number formats consistent across charts; show units where applicable.
- Use a consistent, readable color palette and avoid unnecessary decoration that competes with the data.
- Arrange high-level patient and condition summaries before the detailed comparisons to support a natural reading order.

Published Tableau dashboard and Story

Dashboard validation checklist

Check	Expected result
Dashboard opens	Published Tableau view loads without an error.
Visual titles and labels	Chart titles, labels, legends and units are readable.
Comparisons	Disease counts and risk-factor comparisons are understandable.
Filters	Any available filters update the relevant views as expected.
Consistency	Displayed findings match the underlying worksheets and data.
Website integration	Embedded dashboard and story display on the Health360 webpage; direct links open correctly.

Activity 2

Publish Dashboard on Tableau Public and Paste the Dashboard Public link below:
