Story

Date	27 October 2026
Team ID	
Project Name	Health360: Smart Healthcare & Risk Factor Analysis
Maximum Marks	5 Marks

Purpose of the Tableau Story

The Health360 Tableau Story brings together eight selected visualizations to help viewers explore patient demographics, lifestyle factors and relationships between selected health indicators. The story supports descriptive analysis of patterns in the dataset. The visualizations should not be interpreted as evidence of causation, a clinical diagnosis, or a substitute for professional medical advice.

Story sequence and observations

Story point / worksheet	What the viewer should learn
1. Exercise Level Distribution	Explore how patients are distributed across the exercise-level categories shown in the dataset.
2. Average Blood Pressure Across Age Groups	Compare the displayed average blood-pressure values across age groups.
3. Alcohol & Smoking by Age Group	Review how the selected alcohol and smoking measures vary across age groups.
4. BMI Category vs Heart Disease Rate	Compare the displayed heart-disease rate across BMI categories.
5. Heart Disease vs Diabetes Prevalence	Examine the displayed prevalence measures for heart disease and diabetes and compare their patterns.
6. Patient Distribution by Age Group	Understand the distribution of patient records across the age groups used in the analysis.
7. Heart Disease by BMI Category and Exercise Level	Explore the combined pattern shown across BMI categories and exercise levels.
8. Age Group Distribution by Fatigue Condition	Compare the age-group distribution across the fatigue conditions represented in the visualization.

Observations to communicate

- The story includes eight worksheets that focus on exercise, blood pressure, alcohol and smoking, BMI, disease prevalence, age distribution and fatigue condition.
- Each visualization should be introduced with a short explanation of what is being compared and what measure is displayed.
- Describe patterns as associations or differences visible in the dataset; do not claim that a factor causes a disease.
- Use the measure names, categories, units and rates exactly as defined in the Tableau workbook.
- Avoid reporting exact values unless they have been checked against the final published views.
