Project Development Phase
Performance Test

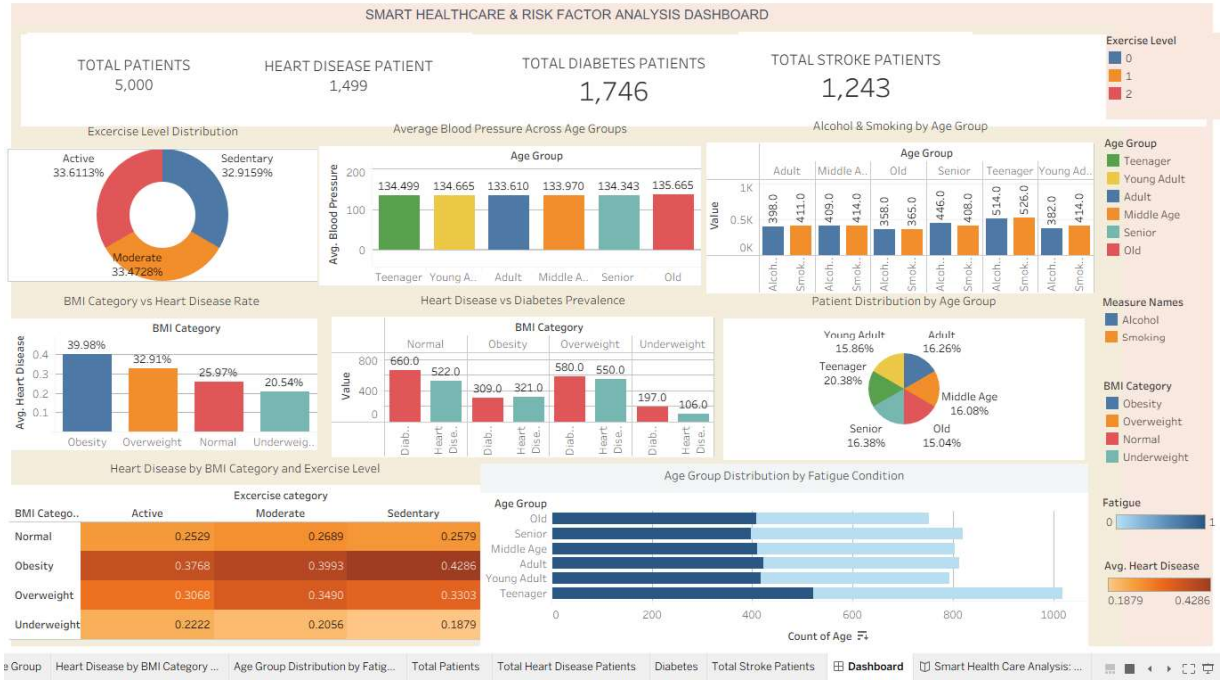

Date	27 October 2026
Team ID	
Project Name	Health360: Smart Healthcare & Risk Factor Analysis
Maximum Marks	

Project Performance Testing:

S.No.	Parameter	Screenshot / Values
1.	Data Rendered	Dashboard summary indicates 5,000 total patients. Confirm that the connected source loads the expected patient records and fields in Tableau, and that all dashboard worksheets render without errors. Record actual source row and column counts from the workbook; do not infer them from dashboard totals.
2.	Data Preprocessing	Review field names and data types used for age group, BMI category, exercise level, blood pressure, alcohol consumption, smoking, heart disease, diabetes, and fatigue condition. Check missing values, inconsistent category labels, and duplicate patient records in the source data.
3.	Utilization of Filters	Test each filter actually available in the published dashboard, such as age group, BMI category, or exercise level. Confirm selections update relevant views consistently. Do not report filters as tested unless they are present in the workbook.
4.	Calculation fields Used	Verify calculations and aggregations used in the views, including average blood pressure across age groups, heart disease rate by BMI category, heart disease and diabetes prevalence comparisons, and the BMI-category-by-exercise-level heatmap. Check calculation definitions before recording formulas or interpreting rates.
5.	Dashboard design	Review chart titles, axes, legends, labels, units, layout, readability, and cross-view consistency. Record the actual number of dashboard views from the workbook. Confirm the embedded dashboard displays correctly on the project website at desktop and mobile widths.

6	Story Design	Open the published Tableau Story and verify these eight confirmed views load in sequence: Exercise Level Distribution; Average Blood Pressure Across Age Groups; Alcohol & Smoking by Age Group; BMI Category vs Heart Disease Rate; Heart Disease vs Diabetes Prevalence; Patient Distribution by Age Group; Heart Disease by BMI Category and Exercise Level; Age Group Distribution by Fatigue Condition. Check titles and readability; conclusions should describe associations rather than claim causation.
